Results from a numerical evaluation of LANCELOT B

Nicholas I. M. Gould[1,2] Dominique Orban[3] and Philippe L. Toint[4,5]

ABSTRACT

In this report, we present the results of testing the GALAHAD library package LANCELOT B on the CUTEr test set.

1 Introduction

LANCELOT B is an updated version of our ancient nonlinear programming package LANCELOT A (see Conn, Gould and Toint, 1992) that has just been released as part of the GALAHAD optimization software library (see Gould, Orban and Toint, 2002*b*). New features include

- complete recoding in Fortran 90,
- the automatic allocation of workspace,
- a non-monotone descent strategy (see Toint, 1997, and Conn, Gould and Toint, 2000, §10.1) to be used by default,
- the optional use of Moré and Toraldo (1991)-type projections (see also Lin and Moré, 1999*a*) during the subproblem solution phase,
- an interface to Lin and Moré's (1999*b*) public domain incomplete Cholesky factorization package ICFS for use as a preconditioner, and
- the optional use of structured trust regions to better model structured problems (see Conn, Gould, Sartenaer and Toint, 1996, and Conn et al., 2000, §10.2), and
- more flexibility over the choice of derivatives—derivatives need only be provided for a subset of the element functions from which the problem is built, the remainder being estimated by differences or secant approximations.

In this report, we present the results of testing LANCELOT B on all of the CUTEr (see Gould, Orban and Toint, 2002*a*) test examples (save linear and quadratic programs for which there are much better specialized packages within GALAHAD).

2 Results

All of our experiments were performed on a single processor of a Compaq AlphaServer DS20 with 3.5 Gbytes of RAM, using the Compaq f90 compiler with full, machine specific, optimization. Each run was terminated unsuccessfully after 30 minutes or after 10000 function evaluations. We considered the following options:

1. The default (in which a non-monotone descent strategy, with a history length of 1, a band preconditioner, with semi-bandwidth 5, exact second derivatives) is used.
2. The default, except that a monotone descent strategy is used.
3. The default, except that SR1 approximations to the second derivatives are used.
4. The default, except that the Lin and Moré's (1999*b*) incomplete Cholesky factorization preconditioner, ICFS, with 5 extra work vectors, is used.
5. the default, except that the Moré and Toraldo (1991) projected search, with 5 restarts, is used.
6. The default, except that a structured trust region (see Conn et al., 1996), is used.
7. The default, except that the history length for the non-monotone descent strategy is increased to 5, is used.

By way of a comparison, LANCELOT A, with its defaults (A), is also used.

A (t) indicates that the time limit was exceeded, an (f) indicates that the maximum number of allowed function evaluations was exceeded, an (o) that the algorithm was unable to evaluate a problem function, and an (i) that the algorithm could not find a feasible point.

In Table 2.1, we give the CPU times (in seconds) for each CUTEr problem and all of the above options, while in Table 2.2 we do the same for the number of function evaluations. We refer the reader to Gould et al. (2002*b*) for a graphical interpretation of these results, as well as any conclusions we believe can reasonably be drawn.

Table 2.1: CPU times in seconds for various options.
